In 2008, adults aged 50 or older comprised approximately 31 percent of the total U.S. population.¹ This older adult population is projected to place a growing burden on the substance abuse treatment system.² Data show a substantial rise in the number of admissions to substance abuse treatment among this age group, as well as significant changes in the sociodemographic characteristics of these treatment admissions. Characteristics of treatment admissions aged 50 or older can be examined with the Treatment Episode Data Set (TEDS), which collects information on the characteristics of persons admitted to substance abuse treatment. This report examines the sociodemographic characteristics of adult treatment admissions aged 50 or older (also referred to as “older admissions”) from 1992 to 2008. A previous report examined changes in the substances of abuse among this population.³ In 1992, there were approximately 102,700 substance abuse treatment admissions aged 50 or older. By 2008, the number more than doubled to approximately 231,200.

**Gender and Race/Ethnicity**

Between 1992 and 2008, there was an increase in the proportion of female admissions aged 50 or older (18.1 to 25.1 percent) (Figure 1). However, males continued to comprise the majority of this treatment population.

In 2008, as in 1992, non-Hispanic Whites formed the majority of older admissions. However, during the 17-year period, the proportion of non-Hispanic White admissions decreased (from 65.8 percent in 1992 to 55.6 percent in 2008) while the proportion of non-Hispanic Black admissions and Hispanic admissions increased (from 19.9 to 28.8 percent and from 9.8 to 11.3 percent respectively) (Figure 2).

**Education, Employment, and Income**

Overall, the education level of older treatment admissions increased over time. Among this age group, the percentage of these admissions who were high school graduates increased (from 35.1 percent in 1992 to 40.8 percent in 2008) as well as those who had completed some college (from 22.5 percent in 1992 to 31.3 percent in 2008).
in 2008). Admissions having less than a high school diploma or GED decreased from 42.4 percent in 1992 to 27.9 percent in 2008.

Unemployment among older treatment admissions rose from nearly one fifth (19.4 percent) in 1992 to nearly one third (31.0 percent) in 2008. In comparison, the proportion employed full-time declined (from 23.4 percent in 1992 to 16.7 percent in 2008) (Figure 3).

The principal source of income for admissions in this age group also changed over time. Among admissions aged 50 or older, wages/salary as a principal source of income dropped from 32.3 percent in 1992 to 24.4 percent in 2008 (Figure 4). Further, the percentage of admissions in this age group that reported that they had no principal source of income at the time of admission to substance abuse treatment more than doubled from 1992 (11.0 percent) to 2008 (28.8 percent).

### Marital Status and Living Arrangement

The data also show shifting trends in marital status and types of living arrangements (homeless, independent living, or dependent living). In 2008, a greater proportion of older treatment admissions reported that they had never married than in 1992. Admissions that had never married more than doubled between 1992 (13.2 percent) and 2008 (30.3 percent), while there were decreases in the proportions of those who were currently married (33.3 percent in 1992 vs. 21.5 percent in 2008) or divorced/widowed (43.9 percent in 1992 vs. 39.9 percent in 2008). Homelessness slightly increased from 15.9 percent in 1992 to 19.5 percent in 2008, while the percentage of admissions residing in independent living situations decreased from 72.4 to 67.1 percent.

### Discussion

The information provided in this report depicts the changing sociodemographic and socioeconomic characteristics of substance abuse treatment admissions aged 50 or older, and highlights possible areas of need among this group. Unemployment, lack of income, and homelessness among these treatment admissions grew between 1992 and 2008. These findings suggest that this population may need financial assistance with the costs associated with substance abuse treatment. Additional case management programs and services may be needed to help individuals in this age group who are currently in treatment or transitioning out of treatment find housing and employment. The data show that increasing numbers of admissions in this age group reported that they had never married.
This finding draws attention to a possible need for additional social support for these admissions as they progress through and transition out of treatment. Finally, the growing number of admissions to treatment aged 50 or older who were female, Black, or Hispanic indicate the need for gender and culturally appropriate services.

End Notes

4 Source of income support is a Supplemental Data Set item. The 15 States and jurisdictions in which it was reported for at least 75 percent of all admissions aged 12 or older in 1992, 2000, and 2008—HI, IA, ID, IL, KS, ME, MN, ND, NE, NV, NY, OH, OK, OR, RI, SD, TX—accounted for 32.2 percent of all substance abuse treatment admissions aged 12 or older in 1992, 35.6 percent of all such admissions in 2000, and 38.2 percent of all such admissions in 2008.

5 Marital status is a Supplemental Data Set item. The 32 States and jurisdictions in which it was reported for at least 75 percent of all admissions aged 12 or older in 1992, 2000, and 2008—AL, AR, CO, FL, HI, IA, ID, IL, IN, KS, LA, MA, MD, ME, MI, MN, MO, NC, ND, NE, NH, NJ, NV, OK, OR, PA, RI, SC, SD, TN, TX, WY—accounted for 57.3 percent of all substance abuse treatment admissions aged 12 or older in 1992, 54.9 percent of all such admissions in 2000, and 54.1 percent of all such admissions in 2008.

6 Living arrangement is a Supplemental Data Set item. The 25 States and jurisdictions in which it was reported for at least 75 percent of all admissions aged 12 or older in 1992, 2000, and 2008—CO, HI, IA, ID, IL, IN, KS, LA, MA, MD, ME, MI, MN, ND, NE, NH, NJ, NV, NY, OH, OK, OR, RI, SD, TX—accounted for 59.5 percent of all substance abuse treatment admissions aged 12 or older in 1992, 56.1 percent of all such admissions in 2000, and 60.8 percent of all such admissions in 2008.
